With the new IEF enquiry configurator to customised linear actuators:

## Reach your goal much faster

The selection of a suitable linear system is based on various factors. The new enquiry configurator from IEF-Werner supports the user in selecting these factors according to their individual requirements. With just a few clicks, the linear systems can be matched to the user's own application and a non-binding enquiry can be sent to the IEF-Werner sales team.

Furtwangen, 18.01.2022 - Whether spindle, toothed belt or direct drive - IEF-Werner GmbH from Furtwangen in the Black Forest offers linear units that, depending on the application, are very dynamic and precise for handling and assembly work, highly accurate and rigid enough in measuring machines - or can withstand high mechanical stresses. IEF-Werner now offers the enquiry configurator for adapting a single linear drive or a multi-axis system to one's own individual requirements. The online tool guides the user in just a few steps through the query of all relevant factors - for example, the ambient conditions, the payload, the available installation space, the cycle time or the drives. The user can also coordinate the control technology. This allows his individual task to be described precisely.

After successful configuration, the programme sends the task automatically and without obligation to the IEF product specialists and sales staff, who use this information to create a quotation as quickly as possible. Here, the user benefits from IEF-Werner's many years of experience and know-how. Within a very short time, the customer receives a concrete offer that can serve as the basis for a further consultation.

The new configurator is available in German and English. Users can find it on the homepage:
